PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.
SQ   Sequence   2994 BP;    974 A;    618 C;    593 G;    809 T;

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 180-184; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT Controlling cancer -
PT by replacing ineffective cancer suppressing gene with cloned,
PT active gene.
PS Claim 35; Page 86; 105pp; English.
CC Gene is taken from human chromosome 13q14 retinoblastoma (RB) cDNA.
CC By installing a working CSG, safe and specific treatment and
CC prophylaxis can be given to cancer patients.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.
SQ   Sequence   3555 BP;     1171 A;     684 C;     653 G;     1047 T;

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.
SQ   Sequence   2994 BP;    974 A;    618 C;    593 G;    809 T;

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 226-230; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 158-162; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
```

```
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.
SQ   Sequence   3555 BP;    1171 A;    684 C;    653 G;    1047 T;

PT   New fusion polypeptide of, e.g. transcription factor - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis.
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465). A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain. Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease. Tissue-specific expression of E2F-RB fusions is
CC   provided. The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.
SQ   Sequence   2994 BP;    974 A;    618 C;    593 G;    809 T;

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 196-200; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
```

```
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 142-147; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 180-184; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers.
PS   Disclosure; Pages 145-150; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.
SQ   Sequence   3218 BP;    1080 A;    595 C;    561 G;    982 T;

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 203-207; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Method of controlling cell cycle progression - uses purified
PT retinoblastoma protein or fragment, for use in combination with
PT therapeutic methods to arrest tumorigenesis
PS Disclosure; Fig 9; 68pp; English.
CC The sequence is that of the retinoblastoma gene which encodes the
CC retinoblastoma (RB) protein which may be used as part of a method of
CC controlling cell cycle progression which may be used in combination
CC with therapeutic methods to arrest tumourigenesis in organisms. The
CC cell cycle can be reversibly arrested in a convenient and safe
CC manner. The protein is used in a compsn. is relatively inexpensive
CC and readily obtainable, and shows little or no toxic effects on
CC healthy cells. It is also compatible with other methods and devices
CC for regulating certain physiological processes of the body, such as
CC blood cell prodn. and gamete prodn. Fragments of the protein are
CC soluble in low concns. of glycerol thus enhancing their value in
CC pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 210-215; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 210-215; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
```

```
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 203-207; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 180-184; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PS   Claim 22; Page 218-222; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.
SQ   Sequence   3383 BP;    1104 A;    657 C;    623 G;    999 T;

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT   Broad spectrum tumour suppressor gene - by using retinoblastoma
PT   gene product p94RB to suppress abnormal cell proliferation in the
PT   treatment of cancer
PS   Claim 4; Fig 1; 115pp; English.
CC   Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC   gene) which encodes the 94kD therapeutic retinoblastoma protein
CC   R63564. Expression of this protein in an abnormally proliferating
CC   cell causes that cell to enter a senescent-like state, terminating
CC   the proliferation. R63564 also has the advantage of engendering a low
CC   incidence of tumour suppressor gene resistance in a population of
CC   treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 210-215; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Disclosure; Page 121-126; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 150-155; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 166-170; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 226-230; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT   Method of controlling cell cycle progression - uses purified
PT   retinoblastoma protein or fragment, for use in combination with
PT   therapeutic methods to arrest tumorigenesis
PS   Disclosure; Fig 9; 68pp; English.
CC   The sequence is that of the retinoblastoma gene which encodes the
CC   retinoblastoma (RB) protein which may be used as part of a method of
CC   controlling cell cycle progression which may be used in combination
CC   with therapeutic methods to arrest tumourigenesis in organisms. The
CC   cell cycle can be reversibly arrested in a convenient and safe
CC   manner. The protein is used in a compsn. is relatively inexpensive
CC   and readily obtainable, and shows little or no toxic effects on
CC   healthy cells. It is also compatible with other methods and devices
CC   for regulating certain physiological processes of the body, such as
CC   blood cell prodn. and gamete prodn. Fragments of the protein are
CC   soluble in low concns. of glycerol thus enhancing their value in
CC   pharmaceutical applicns.

PT Broad spectrum tumour suppressor gene - by using retinoblastoma
PT gene product p94RB to suppress abnormal cell proliferation in the
PT treatment of cancer
PS Claim 4; Fig 1; 115pp; English.
CC Q72690 is the fragment of p94RB (a broad-spectrum tumour suppressor
CC gene) which encodes the 94kD therapeutic retinoblastoma protein
CC R63564. Expression of this protein in an abnormally proliferating
CC cell causes that cell to enter a senescent-like state, terminating
CC the proliferation. R63564 also has the advantage of engendering a low
CC incidence of tumour suppressor gene resistance in a population of
CC treated cells.

PT   Retinoblastoma suppressor protein with N-terminal modification -
PT   inhibiting cellular proliferation, particularly cancer
PS   Claim 22; Page 188-192; 249pp; English.
CC   This sequence encodes a modified retinoblastoma tumour suppressor
CC   protein (RTSP) of the invention. The proteins can be used for inhibiting
CC   cellular proliferation, when coadministered with a p53 protein. The RTSPs
CC   can be used for treating diseases characterised by abnormal cellular
CC   proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC   activity than wild type RTSPs.

PT Retinoblastoma suppressor protein with N-terminal modification -
PT inhibiting cellular proliferation, particularly cancer
PS Claim 22; Page 166-170; 249pp; English.
CC This sequence encodes a modified retinoblastoma tumour suppressor
CC protein (RTSP) of the invention. The proteins can be used for inhibiting
CC cellular proliferation when coadministered with a p53 protein. The RTSPs
CC can be used for treating diseases characterised by abnormal cellular
CC proliferation, particularly cancers. The RTSPs have a broader spectrum of
CC activity than wild type RTSPs.

PT New tetracycline responsive expression vectors - used for the
PT tightly controlled expression of genes, such as tumour suppressor
PT genes for treating cancers
PS Disclosure; Pages 145-150; 190pp; English.
CC The present sequence appears in the specification, which describes a
CC tetracycline responsive expression vector (TREV), which contains a
CC sequence encoding a fusion protein comprising a transcriptional
CC transactivation domain (TTD) operatively attached to a tetracycline
CC repressor protein (TRP), the first sequence operatively positioned
CC downstream of a promoter. The vector also contains a cloning site
CC operatively positioned downstream of a basal promoter comprising a
CC tetracycline operator. The TREVs can be used to produce stable cell
CC lines in which gene expression is tightly regulated by tetracycline.
CC They can be used for the production of proteins such as tumour
CC suppressor proteins which can be used for treating diseases characterised
CC by abnormal cellular proliferation, particularly cancers.

PT   New tetracycline responsive expression vectors - used for the
PT   tightly controlled expression of genes, such as tumour suppressor
PT   genes for treating cancers
PS   Disclosure; Pages 153-157; 190pp; English.
CC   The present sequence appears in the specification, which describes a
CC   tetracycline responsive expression vector (TREV), which contains a
CC   sequence encoding a fusion protein comprising a transcriptional
CC   transactivation domain (TTD) operatively attached to a tetracycline
CC   repressor protein (TRP), the first sequence operatively positioned
CC   downstream of a promoter. The vector also contains a cloning site
CC   operatively positioned downstream of a basal promoter comprising a
CC   tetracycline operator. The TREVs can be used to produce stable cell
CC   lines in which gene expression is tightly regulated by tetracycline.
CC   They can be used for the production of proteins such as tumour
CC   suppressor proteins which can be used for treating diseases characterised
CC   by abnormal cellular proliferation, particularly cancers.

PT   New fusion polypeptide of, e.g. transcription factor  - used to
PT   treat, e.g. hyper-proliferative disease such as cancer and
PT   restenosis
PS   Example 1; Fig 2A; 91pp; English.
CC   This nucleotide sequence includes a coding region for retinoblastoma
CC   protein RB (see W62465).  A new claimed polypeptide is a fusion of:
CC   (i) a transcription factor (TF) comprising a DNA binding domain,
CC   and (ii) a retinoblastoma (Rb) polypeptide that includes a growth
CC   suppression domain.  Also new are: (1) a nucleic acid encoding the
CC   fusion protein, and (2) expression vectors containing such DNA.
CC   The fusion protein, particularly expressed from gene therapy
CC   vectors (especially adenovirus vectors), is used to treat
CC   hyperproliferative conditions, specifically cancer (particularly of
CC   the bladder) or restenosis (after angioplasty), but also diabetic
CC   retinopathy, thyroid hyperplasia, Grave's disease, psoriasis,
CC   benign prostatic hypertrophy, Li-Fraumeni syndrome and peripheral
CC   vascular disease.  Tissue-specific expression of E2F-RB fusions is
CC   provided.  The fusion proteins are more effective in repressing
CC   transcription of the E2F promoter than Rb alone and cause cell-cycle
CC   arrest in a variety of cells.

PT   Inhibition of cancer cell proliferation - with retinoblastoma
PT   protein or polypeptide
PS   Example 1; Fig 2A-K; 72pp; English.
CC   The present sequence encodes a human retinoblastoma (RB) protein
CC   designated ppRB-110 or p110-RB. The protein is used in a method
CC   for inhibiting proliferation of pathologically proliferating cells
CC   lacking endogenous functional retinoblastoma protein. The method
CC   comprises contacting the cells with a polypeptide comprising a 56 kD
CC   C-terminal fragment of retinoblastoma protein. The method is useful
CC   for treating cancers, especially retinoblastoma or secondary
CC   osteosarcoma, breast cancer, small-cell lung cancer or fibrosarcoma.
